How are we using AI at TradeRange?

LLMs changed how software gets built.

Updated 4 Nov 2026

Read online: https://traderange.net/blog/our-use-of-ai-faoaspzz/

Thank you to those of you who have offered feedback about TradeRange or Tradely on any of our platforms! It is nice to hear from you. A thing we hear very often is "Is this written by AI?" or "Is this UI AI?". We understand your scepticism and would like to address it directly by announcing a few major updates and changes surrounding TradeRange.

AI Assisted Tags

Articles that are written by or with AI are now marked by a new **AI Assisted** tag. You can see them appear across articles already! This is here to offer clear communication from us to you regarding the origin of content. We had originally considered this showing what model was used, but with how heavily models vary even in the process of drafting a single article based of the goal in mind we have realised that articles involve between 2-5 models each, hence while we track this internally it is not displayed publicly to avoid cluttering the UI. This is a **BETA feature** and we are still assessing the SEO/GEO and human implications of using the tags publicly. If it becomes a hassle we may remove them, but to maintain our honesty we will continue tracking it internally, as we have been from the start.

MCP Server for Articles

Thank you to BitIlia for developing this feature, which is going to be explained in the next couple of lines. The MCP server is currently exclusively for internal use, but may be expanded with other features, which will be publicly available. Currently, the MCP Server allows us 3 main things:

- Give AI access to our articles directly, which makes it easier for AI to use our writing style and generate quality content.
- To draft articles in an easy manner automatically
- To publish our AI News Brief and update it throughout the day, more on that later.

AI News Brief

We were hesitant to give AI Access to users through our platform, as there are plenty of stories on Reddit about people being billed thousands because they didn't safeguard their API Key enough. We are still working on **AI Generated Summaries of Individual Portfolios** and will continue doing so, as it is the most demanded feature.

For now, we are offering a daily summary of the biggest news articles of the day directly on our website, via the home screen and via the posts page. This should make catching up with the daily news in the morning just a tiny bit easier! This is done by using the MCP Server with a scheduled task. The current model being used is **Claude Haiku 4.5**, which delegate to **Sonnet 5** if it can't decide which articles are more important. We spent nearly a month refining the prompt to produce the kind of short summaries you see here today. We remain on the look-out for cheaper options that will produce a better result, but after trying all the cheapest frontline models we have decided to use Anthropic for the time being.

Roadmap Announcement: AI Generated Summaries of Individual Portfolios

As mentioned earlier we will be working on offering you a customised experience, but currently this isn't even in Alpha for us due to the high security risks associated. Expect an update within around 60 days.

If you are interested about specific details you can reach out via our discord.

> **What is an MCP?**
> The Model Context Protocol (MCP) is an open-source framework introduced by Anthropic in November 2024 that standardizes how a model can communicate with an external service.
